Paper 5 Planning, Analysis and Evaluation

October/November 2011

1 hour 15 minutes

Candidates answer on the Question Paper.

No Additional Materials are required.

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use a soft pencil for any diagrams, graphs, or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer **all** questions.

You are advised to show all working in calculations.

Use of Data Booklet is unnecessary.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

For Examiner's Use

Total	

This document consists of **8** printed pages and **4** blank pages.

- 1 When potassium nitrate dissolves in water, the temperature of the solution goes down because the enthalpy of solution is endothermic.

You are to plan an experiment to investigate how the solubility of potassium nitrate varies with temperature. The units of solubility are grams per one hundred grams of water (g/100g water).

- (a) (i) Predict how the solubility of potassium nitrate will change if the solution temperature is **increased**.

Explain your prediction using the fact that dissolving potassium nitrate is endothermic.

prediction

.....

explanation

.....

.....

.....

- (ii) Display your prediction in the form of a sketch graph, labelling clearly the axes.

[3]

- (b) In the experiment you are about to plan, identify the following.

(i) the independent variable

(ii) the dependent variable

[2]

- (d) State a hazard that must be considered when planning the experiment and describe precautions that should be taken to keep risks to a minimum.

*For
Examiner's
Use*

.....
..... [1]

- (e) Draw a table with appropriate headings to show the data you would record when carrying out your experiments and the values you would calculate in order to construct a graph to support or reject your prediction in (a). The headings **must** include the appropriate units.

[2]

[Total: 15]

- 2 Chemical reactions occur more rapidly as the temperature of the reaction mixture increases. The mathematical relationship that summarises this is

$$\log_{10} (\text{rate of reaction}) = \frac{-E_A}{19T}$$

where E_A is the **activation energy** of the reaction and T is the **absolute temperature** in Kelvin and the **rate of reaction** can be taken as the reciprocal of the time taken in seconds (**1/time**).

An experiment was carried out to investigate this relationship using dilute hydrochloric acid and aqueous sodium thiosulfate.

- 20 cm³ of dilute hydrochloric acid was placed in a boiling tube contained in a water bath.
- 20 cm³ of aqueous sodium thiosulfate was added to the dilute hydrochloric acid, while stirring and a stopwatch started.
- The temperature of the water bath was recorded.
- After a period of time the liquid became cloudy (opaque) due to the formation of a precipitate of sulfur.
- As soon as this cloudiness (opacity) appeared the time was recorded.
- The temperature of the water bath was raised and the whole experiment repeated.

- (a) The results of several such experiments are recorded below.

Process the results in the table to calculate **log₁₀ (rate of reaction)**, the reciprocal of the absolute temperature (**1/T**) and the 'rate of reaction' (**1/time**). You should expect the values of **log₁₀ (rate of reaction)** to be negative.

Record these values to **three significant figures** in the additional columns of the table.

Label the columns you use. For each column you use include units where appropriate and an expression to show how your values are calculated.

You may use the column headings A to F for these expressions (e.g. A–B). [3]

A	B	C	D	E	F
temperature / °C	absolute temperature / K	time / s			
20.0	293	60.3			
30.0	303	46.8			
40.0	313	41.6			
45.0	318	31.6			
50.0	323	28.8			
55.0	328	25.1			
60.0	333	21.0			
65.0	338	20.4			
70.0	343	18.1			
80.0	353	15.1			

- (b) Plot a graph to show the relationship between \log_{10} (rate of reaction) and the reciprocal of the absolute temperature. You are reminded that the values for \log_{10} (rate of reaction) are negative.
Draw the line of best fit.

[3]

- (c) Circle and label on the graph any point(s) you consider to be anomalous. For each anomalous point give a different reason why it is anomalous, clearly stating which point you are describing.

For
Examiner's
Use

.....
.....
.....
.....
.....
.....
.....
..... [3]

- (d) Comment on whether the results obtained can be considered as reliable.

.....
..... [1]

- (e) Determine the slope of the graph. Mark clearly on the graph any construction lines and show clearly in your calculation how the values from the intercepts were used in the calculation of the slope.

[2]

- (f) Using the value of the slope of your graph calculated in (e) calculate a value for the **activation energy, E_A** . Correct use of the equation will produce an answer in kJ mol^{-1} .

[1]

- (g) By considering the movement of particles in the reaction explain why the rate of reaction increases with increasing temperature.

This document consists of **8** printed pages and **4** blank pages.

- 1 If a container of gas has a tiny hole in it, the gas will gradually escape through the hole. This process is called **effusion** and the rate at which it occurs is called **the rate of effusion**.

For
Examiner's
Use

You are to plan an experiment to investigate how the **rate of effusion** depends on the **relative molecular mass, M_r** , of a gas.

- (a) At a constant temperature, the rate of effusion of a gas depends on the kinetic energy of the molecules of the gas. So, for a series of gases all at the same temperature, as the M_r of a gas increases the speed of the molecules of the gas decreases.

- (i) Predict how the rate of effusion will change as the M_r of the gas **increases**. Explain your prediction using the information in part (a) above.

[Total: 15]

- 2 There are three oxides of lead, PbO , PbO_2 and Pb_3O_4 all of which can be reduced to metallic lead by hydrogen. A sample of one of these oxides is reduced to find out which of the three oxides it is.

For
Examiner's
Use

An experiment was carried out as follows.

- An empty reduction tube was weighed and the mass recorded.
- A sample of the lead oxide was added to the reduction tube and the new mass recorded.
- The reduction tube and lead oxide was heated strongly for five minutes in a stream of hydrogen and then allowed to cool back to room temperature.
- The reduction tube and contents were then reweighed and the mass recorded.

(a) The results of several such experiments are recorded below.

[A_r : O, 16.0; Pb, 207.0]

Process the results in the table to calculate the number of moles of lead **atoms** and the number of moles of oxygen **atoms**.

Record these values in the additional columns of the table. You may use some or all of the columns. Label the columns you use.

Masses should be recorded to **two decimal places** while the number of moles should be recorded to **two significant figures**.

For each column you use include units where appropriate and an expression to show how your values are calculated.

You may use the column headings A to G for these expressions (e.g. A–B). [3]

A	B	C	D	E	F	G
mass of reduction tube /g	mass of reduction tube + lead oxide /g	mass of reduction tube + lead /g
