Question Number	Scheme	Marks
1. (a)	$f'(x) = 3x^2 + 6x$	B1
	$f''(x) = 6x + 6$	M1, A1cao (3)

Notes   cao = correct answer only

1(a)	
Acceptable alternatives include $3x^2 + 6x^1$; $3x^2 + 3\times2x$; $3x^2 + 6x + 0$ Ignore LHS (e.g. use [whether correct or not] of $\frac{dy}{dx}$ and $\frac{d^2y}{dx^2}$) $3x^2 + 6x + c$ or $3x^2 + 6x$ + constant (i.e. the written word constant) is B0	B1
M1 Attempt to differentiate their $f'(x)$; $x^n \to x^{n-1}$. $x^n \to x^{n-1}$ seen in at least one of the terms. Coefficient of $x^{\cdots}$ ignored for the method mark. $x^2 \to x^1$ and $x \to x^0$ are acceptable.	M1
Acceptable alternatives include $6x^1 + 6x^0$; $3\times2x + 3\times2$ $6x + 6 + c$ or $6x + 6$ + constant is A0	A1 cao

Question Number	Scheme	Marks
1. (b)	$\int (x^3 + 3x^2 + 5)\,dx = \frac{x^4}{4} + \frac{3x^3}{3} + 5x$	M1, A1
	$\left[\frac{x^4}{4} + x^3 + 5x\right]_1^2 = 4 + 8 + 10 - (\frac{1}{4} + 1 + 5)$	M1
	$= 15\frac{3}{4}$ o.e.	A1 (4) **(7)**

Notes o.e. = or equivalent

1(b)	
Attempt to integrate f(x); $x^n \to x^{n+1}$ Ignore incorrect notation (e.g. inclusion of integral sign)	M1
o.e. Acceptable alternatives include $\frac{x^4}{4} + x^3 + 5x$; $\frac{x^4}{4} + \frac{3x^3}{3} + 5x^1$; $\frac{x^4}{4} + \frac{3x^3}{3} + 5x + c$; $\int \frac{x^4}{4} + \frac{3x^3}{3} + 5x$ N.B. If the candidate has written the integral (either $\frac{x^4}{4} + \frac{3x^3}{3} + 5x$ or what they think is the integral) in part (a), it may not be rewritten in (b), but the marks may be awarded if the integral is used in (b).	A1
Substituting 2 and 1 into any function other than $x^3 + 3x^2 + 5$ and subtracting either way round. So using their f ′(x) or f ′′(x) or $\int$ their f ′(x) dx or $\int$ their f ′′(x) dx will gain the M mark (because none of these will give $x^3 + 3x^2 + 5$). Must substitute for all x s but could make a slip. $4 + 8 + 10 - \frac{1}{4} + 1 + 5$ (for example) is acceptable for evidence of subtraction ('invisible' brackets).	M1
o.e. (e.g. $15\frac{3}{4}$, 15.75, $\frac{63}{4}$) Must be a single number (so $22 - 6\frac{1}{4}$ is A0).	A1
Answer only is M0A0M0A0	

Examples

1(b) $\frac{x^4}{4} + x^3 + 5x + c$ M1 A1

$4 + 8 + 10 + c - (\frac{1}{4} + 1 + 5 + c)$ M1

1(b) $\int_1^2 f(x)\,dx = 2^3 + 3\times2^2 + 5 - (1 + 3 + 5)$ M0 A0, M0

$= 25 - 9$

$= 16$ A0

(Substituting 2 and 1 into $x^3 + 3x^2 + 5$, so 2nd M0)

1(b) $\int_1^2 (6x+6)\ dx = \left[3x^2+6x\right]_1^2$ M0 A0

$= 12 + 12 - (3 + 6)$ M1 A0

$\frac{2^4}{4}+2^3+5\times 2-\frac{1^4}{4}+1^3+5$ M1

(one negative sign is sufficient for evidence of subtraction)

$= 22 - 6\frac{1}{4} = 15\frac{3}{4}$ A1

(allow ‘recovery’, implying student was using ‘invisible brackets’)

1(a) $f(x) = x^3 + 3x^2 + 5$

The candidate has written the integral in part (a). It is not rewritten in (b), but the marks may be awarded as the integral is used in (b).

2. (a)	$(1-2x)^5 = 1 + 5\times(-2x) + \frac{5\times 4}{2!}(-2x)^2 + \frac{5\times 4\times 3}{3!}(-2x)^3 + \ldots$ $= 1 - 10x + 40x^2 - 80x^3 + \ldots$	B1, M1, A1, A1 (4)
(b)	$(1 + x)(1 - 2x)^5 = (1 + x)(1 - 10x + \ldots)$ $= 1 + x - 10x + \ldots$ $\approx 1 - 9x$ (✱)	M1 A1 (2) **(6)**

Notes

2(a)	
$1 - 10x$ $1 - 10x$ must be seen in this simplified form in (a).	B1
Correct structure: 'binomial coefficients' (perhaps from Pascal's triangle), increasing powers of x. Allow slips. Accept other forms: ${}^5C_1$, $\binom{5}{1}$, also condone $\left(\frac{5}{1}\right)$ but must be attempting to use 5. Condone use of invisible brackets and using $2x$ instead of $-2x$. Powers of x: at least 2 powers of the type $(2x)^a$ or $2x^a$ seen for $a \geq 1$.	M1
$40x^2$ (1st A1)	A1
$-80x^3$ (2nd A1)	A1
Allow commas between terms. Terms may be listed rather than added Allow 'recovery' from invisible brackets, so $1^5 + \binom{5}{1}1^4.-2x + \binom{5}{2}1^3.-2x^2 + \binom{5}{3}1^2.-2x^3$ $= 1 - 10x + 40x^2 - 80x^3 + \ldots$ gains full marks. $1 + 5\times(2x) + \frac{5\times 4}{2!}(2x)^2 + \frac{5\times 4\times 3}{3!}(2x)^3 + \ldots = 1 + 10x + 40x^2 + 80x^3 + \ldots$ gains B0M1A1A0	
Misread: first 4 terms, descending terms: if correct, would score B0, M1, 1st A1: one of $40x^2$ and $-80x^3$ correct; 2nd A1: both $40x^2$ and $-80x^3$ correct.	

2(a) Long multiplication	
$(1 - 2x)^2 = 1 - 4x + 4x^2$, $(1 - 2x)^3 = 1 - 6x + 12x^2 - 8x^3$, $(1 - 2x)^4 = 1 - 8x + 24x^2 - 32x^3$ $\{+ 16x^4\}$ $(1 - 2x)^5 = 1 - 10x + 40x^2 + 80x^3 + \ldots$	
$1 - 10x$ $1 - 10x$ must be seen in this simplified form in (a).	B1
Attempt repeated multiplication up to and including $(1 - 2x)^5$	M1

$40x^2$ (1st A1)	A1
$-80x^3$ (2nd A1)	A1
Misread: first 4 terms, descending terms: if correct, would score B0, M1, 1st A1: one of $40x^2$ and $-80x^3$ correct; 2nd A1: both $40x^2$ and $-80x^3$ correct.	

2(b)	
Use their (a) and attempt to multiply out; terms (whether correct or incorrect) in x^2 or higher can be ignored. If their (a) is correct an attempt to multiply out can be implied from the correct answer, so $(1 + x)(1 - 10x) = 1 - 9x$ will gain M1 A1. If their (a) is correct, the 2nd bracket must contain at least $(1 - 10x)$ and an attempt to multiply out for the M mark. An attempt to multiply out is an attempt at 2 out of the 3 relevant terms (N.B. the 2 terms in x^1 may be combined – but this will still count as 2 terms). If their (a) is incorrect their 2nd bracket must contain all the terms in x^0 and x^1 from their (a) AND an attempt to multiply all terms that produce terms in x^0 and x^1. N.B. $(1 + x)(1 - 2x)^5 = (1 + x)(1 - 2x)$ [where $1 - 2x + \ldots$ is NOT the candidate's answer to (a)] $= 1 - x$ i.e. candidate has ignored the power of 5: M0 N.B. The candidate may start again with the binomial expansion for $(1 - 2x)^5$ in (b). If correct (only needs $1 - 10x$) may gain M1 A1 even if candidate did not gain B1 in part (a).	M1
N.B. Answer given in question.	A1

Example

Answer in (a) is $= 1 + 10x + 40x^2 - 80x^3 + \ldots$

(b) $(1 + x)(1 + 10x) = 1 + 10x + x$ M1
$= 1 + 11x$ A0

3.	Centre $\left(\frac{-1+3}{2}, \frac{6+4}{2}\right)$, i.e. (1, 5)	M1, A1
	$r = \frac{\sqrt{(3-(-1))^2+(6-4)^2}}{2}$ or $r^2 = (1 – (–1))^2 + (5 – 4)^2$ or $r^2 = (3 – 1)^2 + (6 – 5)^2$ o.e.	M1
	$(x – 1)^2 + (y – 5)^2 = 5$	M1,A1,A1 **(6)**

Notes

Some use of correct formula in x or y coordinate. Can be implied. Use of $\left(\frac{1}{2}(x_A - x_B), \frac{1}{2}(y_A - y_B)\right) \rightarrow$ (–2, –1) or (2, 1) is M0 A0 but watch out for use of $x_A + \frac{1}{2}(x_A - x_B)$ etc which is okay.	M1
(1, 5) (5, 1) gains M1 A0.	A1
Correct method to find r or r^2 using given points or f.t. from their centre. Does not need to be simplified. Attempting radius = $\sqrt{\frac{(\text{diameter})^2}{2}}$ is an incorrect method, so M0. N.B. Be careful of labelling: candidates may not use d for diameter and r for radius. Labelling should be ignored. Simplification may be incorrect – mark awarded for correct method. Use of $\sqrt{(x_1 - x_2)^2 - (y_1 - y_2)^2}$ is M0.	M1
Write down $(x \pm a)^2 + (y \pm b)^2$ = any constant (a letter or a number). Numbers do not have to be substituted for a, b and if they are they can be wrong.	M1
LHS is $(x – 1)^2 + (y – 5)^2$. Ignore RHS.	A1
RHS is 5. Ignore subsequent working. Condone use of decimals that leads to exact 5.	A1
Or correct equivalents, e.g. $x^2 + y^2 – 2x – 10y + 21 = 0$.	

Alternative – note the order of the marks needed for ePEN.	
As above.	M1
As above.	A1
$x^2 + y^2$ + (constant)x + (constant)y + constant = 0. Numbers do not have to be substituted for the constants and if they are they can be wrong.	3rd M1
Attempt an appropriate substitution of the coordinates of their centre (i.e. working with coefficient of x and coefficient of y in equation of circle) and substitute (–1, 4) or (3, 6) into equation of circle.	2nd M1
$–2x – 10y$ part of the equation $x^2 + y^2 – 2x – 10y + 21 = 0$.	A1
+21 = 0 part of the equation $x^2 + y^2 – 2x – 10y + 21 = 0$.	A1
Or correct equivalents, e.g. $(x – 1)^2 + (y – 5)^2 = 5$.	

Question Number	Scheme	Marks
4.	$x\log 5 = \log 17$ or $x = \log_5 17$	M1
	$x = \dfrac{\log 17}{\log 5}$	A1
	$= 1.76$	A1 (3)

Notes N.B. It is never possible to award an A mark after giving M0. If M0 is given then the marks will be M0 A0 A0.

Acceptable alternatives include $x\log 5 = \log 17$; $x\log_{10} 5 = \log_{10} 17$; $x\log_e 5 = \log_e 17$; $x\ln 5 = \ln 17$; $x = \log_5 17$ Can be implied by a correct exact expression as shown on the first A1 mark	1st M1
An exact expression for x that can be evaluated on a calculator. Acceptable alternatives include $x = \dfrac{\log 17}{\log 5}$; $x = \dfrac{\log_{10} 17}{\log_{10} 5}$; $x = \dfrac{\log_e 17}{\log_e 5}$; $x = \dfrac{\ln 17}{\ln 5}$; $x = \dfrac{\log_q 17}{\log_q 5}$ where q is a number This may not be seen (as, for example, $\log_5 17$ can be worked out directly on many calculators) so this A mark can be implied by the correct final answer or the right answer corrected to or truncated to a greater accuracy than 3 significant figures or 1.8 Alternative: $x = \dfrac{\text{a number}}{\text{a number}}$ where this fraction, when worked out as a decimal rounds to 1.76. (N.B. remember that this A mark cannot be awarded without the M mark). If the line for the M mark is missing but this line is seen (with or without the x =) and is correct the method can be assumed and M1 1st A1 given.	1st A1
1.76 cao	2nd A1
N.B. $\sqrt[5]{17} = 1.76$ and $x^5 = 17, \therefore x = 1.76$ are both M0 A0 A0	
Answer only 1.76: full marks (M1 A1 A1) Answer only to a greater accuracy but which rounds to 1.76: M1 A1 A0 (e.g. 1.760, 1.7603, 1.7604, 1.76037 etc) Answer only 1.8: M1 A1 A0 Trial and improvement: award marks as for “answer only”.

Attempting f(±2): No x s; allow invisible brackets for M mark Long division: M0 A0.	M1

Invisible brackets used as brackets can get M1 A1, so $f(-2) = -2^3 + 4\times-2^2 + -2 - 6$ { = $-8 + 16 - 2 - 6$} = 0, $\therefore$ $x + 2$ is a factor M1 A1, but $f(-2) = -2^3 + 4\times-2^2 + -2 - 6 = -8 - 16 - 2 - 6 = 0$, $\therefore$ $x + 2$ is a factor M1 A0 Acceptable alternatives include: $x = -2$ is a factor, f(–2) is a factor. <u>Notes</u>

Use of $\cos^2 x=1-\sin^2 x$. Condone invisible brackets in first line if $2-2\sin^2 x$ is present (or implied) in a subsequent line. Must be using $\cos^2 x=1-\sin^2 x$. Using $\cos^2 x=1+\sin^2 x$ is M0.	M1
Attempt to solve a 2 or 3 term quadratic in sin *x* up to sin *x* = … Usual rules for solving quadratics. Method may be factorising, formula or completing the square	M1
Correct factorising for correct quadratic and $\sin x=\frac{1}{2}$. So, e.g. $(\sin x+3)$ as a factor $\rightarrow$ $\sin x=3$ can be ignored.	A1
Method for finding any angle in any range consistent with (either of) their trig. equation(s) in degrees or radians (even if *x* not exact). [Generous M mark] Generous mark. Solving any trig. equation that comes from minimal working (however bad). So $x=\sin^{-1}/\cos^{-1}/\tan^{-1}$(number) $\rightarrow$ answer in degrees or radians correct for their equation (in any range)	M1
Method for finding second angle consistent with (either of) their trig. equation(s) in radians. Must be in range $0 \le x < 2\pi$. Must involve using π (e.g. $\pi \pm \ldots$, $2\pi - \ldots$) but … can be inexact. Must be using the same equation as they used to attempt the 3rd M mark. Use of π must be consistent with the trig. equation they are using (e.g. if using $\cos^{-1}$ then must be using $2\pi - \ldots$) If finding both angles in degrees: method for finding 2nd angle equivalent to method above in degrees and an attempt to change both angles to radians.	M1
$\frac{\pi}{6},\frac{5\pi}{6}$ c.s.o. Recurring decimals are okay (instead of $\frac{1}{6}$ and $\frac{5}{6}$). Correct decimal values (corrected or truncated) before the final answer of $\frac{\pi}{6},\frac{5\pi}{6}$ is acceptable.	A1 cso

Attempt to multiply out, must be a cubic.	M1
Award A mark for their final version of expansion (but final version does not need to have like terms collected).	A1
Attempt to integrate; $x^n \to x^{n+1}$. Generous mark for some use of integration, so e.g. $\int x(x-1)(x-5)\,\mathrm{d}x = \frac{x^2}{2}\left(\frac{x^2}{2}-x\right)\left(\frac{x^2}{2}-5x\right)$ would gain method mark.	M1
Ft on their final version of expansion provided it is in the form $ax^p + bx^q + \ldots$. Integrand must have at least two terms and all terms must be integrated correctly. If they integrate twice (e.g. $\int_0^1$ and $\int_1^2$) and get different answers, take the better of the two.	A1ft

M1 Substitutes and subtracts (either way round) for two integrals. Integral must be a 'changed' function. Must have 1 and 0 and 2 and 1 (or 1 and 2). The two integrals do not need to be the same, but they must have come from attempts to integrate the same function.	M1

The answer must be consistent with the integral they are using (so $\int_1^2 \mathrm{f}(x) = \frac{11}{4}$ loses this A and the final A). $-\frac{11}{4}$ may not be seen explicitly.
